

Clean, clear water has never been easier

Water sediment filtration for residential, commercial and industrial applications

Honeywell F76 Water Filter

All water has sediment, whether from a well, or from nearby construction shaking particles from pipes, or from older pipes releasing their build-up.

Now building and homeowners can say good-bye to *virtually everything* that clouds the water supply—sand and clay, particles from cement pipes, shards from iron pipes, scale from old mineral deposits. A Honeywell F76 Water Filter removes particles smaller than the finest beach sand.

- **Water system appliances will last longer.** The F76 Water Filter removes clogging, corrosive particles from the water that flows through domestic and recreational water systems. The dishwasher, water softener, water heater and ice maker will provide optimum performance when cleaner water flows through them. The sensitive components in swimming pool systems and sprinkler systems will operate more reliably, too.

- **Life will be simpler.** The filter cartridge never needs to be replaced because the F76 filter screen is permanent. Jet cleaning debris from the screen requires a simple turn of a

The Honeywell F76 Water Filter catches particles such as these before they can damage your water appliances, sandblast your fixtures, and clog other point-of-use filters.

dial—with no interruption to the water supply. The filter can even be programmed to clean itself according to a schedule with the addition of the MV876 automatic backwash motor.

- **Fixtures and surfaces will keep their sparkle.** Sediment blasting out of faucets can scratch metal fixtures and ceramic surfaces, robbing them of their natural gleam and making them look old before their time. An F76 filter helps surfaces keep their shine.

- **All this, and no cartridge to replace—EVER. Other water filters may need a new cartridge four or five times a year. The F76 water filter:**

- Saves you money. You won't have to pay for another filter cartridge.
- Saves you time. You won't have to drain your water system.
- Prolongs the life of your point-of-use filters.

The MV876 Automated Backwash Motor is designed to clean your filter automatically, according to a programmed schedule. Instead of waiting for that telltale drop in water pressure, use the Automated Backwash Motor to keep your Honeywell F76 Filter running efficiently. **Just set it once and forget it!**

**Easy-care
water filtration**

Remove sediment before it damages your investments

Use the F76 Water Filter when sediment is present in the water supply, such as in city water or in water from private wells or lakes. It's also recommended for filtering the large volumes of water used for swimming pools, hot tubs and sprinkler systems. Ideal as a prefilter in a purification system.

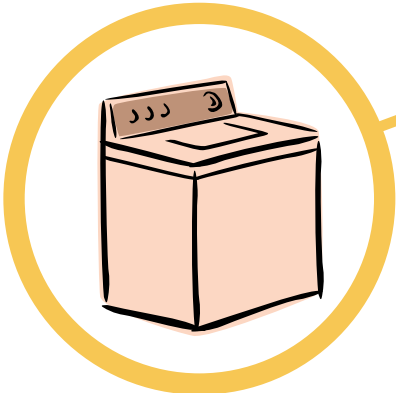

Sediment can cause a loss in water pressure due to clogged pipes and shower heads. It can also sandblast away the luster of fixtures and surfaces.

Many homeowners use a kitchen-sink water filter, but it does nothing to protect the water appliances and fixtures inside and outside the home. The F76 Point-of-Entry water filter removes sediment from water as it enters the house, providing worry-free clear water for every water appliance in the house, and for all its fixtures and surfaces, too.

Cleaner water house-wide means that water softeners, swimming pool systems, water heaters and more will stay cleaner, give maximum performance and need less maintenance.

Sediment-free water keeps your washing machine and dishwasher clean and in top form. It also benefits such appliances as ice makers and dishwashers.

Sediment can clog individual sprinklers and sprinkler-system heads and keep them from watering the full area they otherwise could. An F76 water filter can save hours of lawn-upkeep time.

An F76 house-wide water filter saves money by prolonging the life of your point-of-use taste/odor filters which may require frequent, expensive and messy cartridge changes.

Commercial/Industrial, too!

Available in 1/2"-2" sizes in both standard and high temperature/pressure configurations for various non-drinking water applications.
